

A system is a collection of devices that work together.

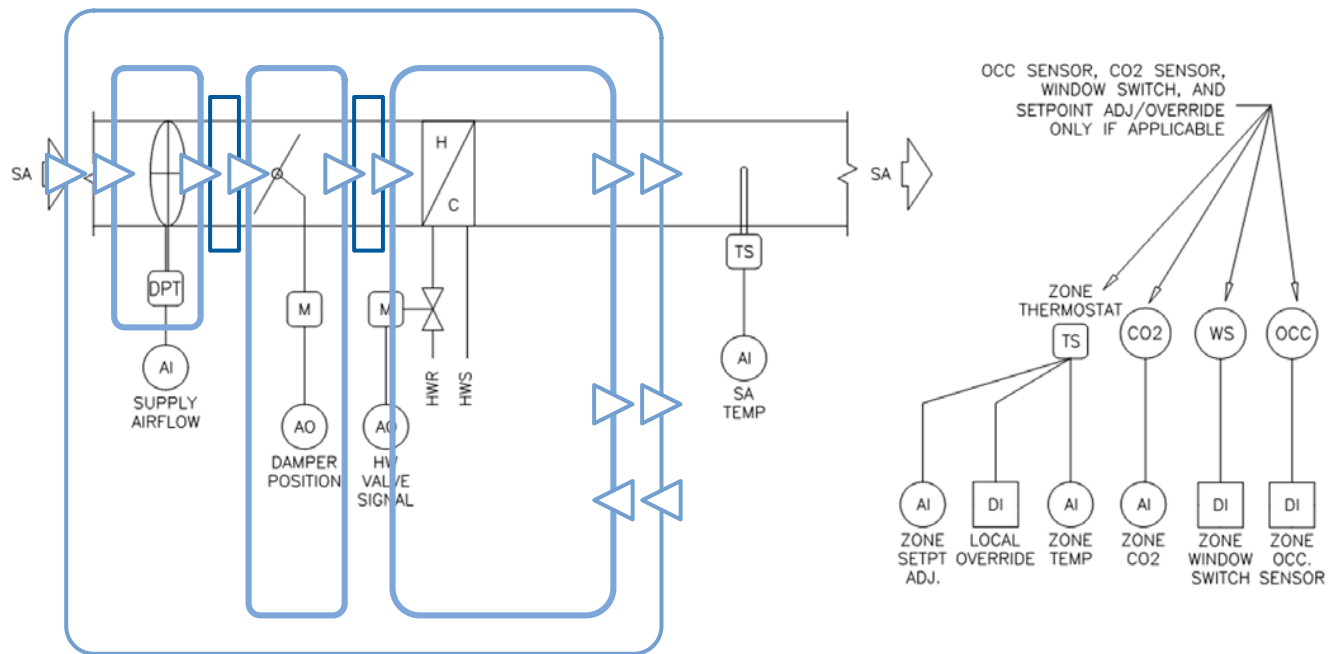

Connection Points are ways systems can be “connected together.”

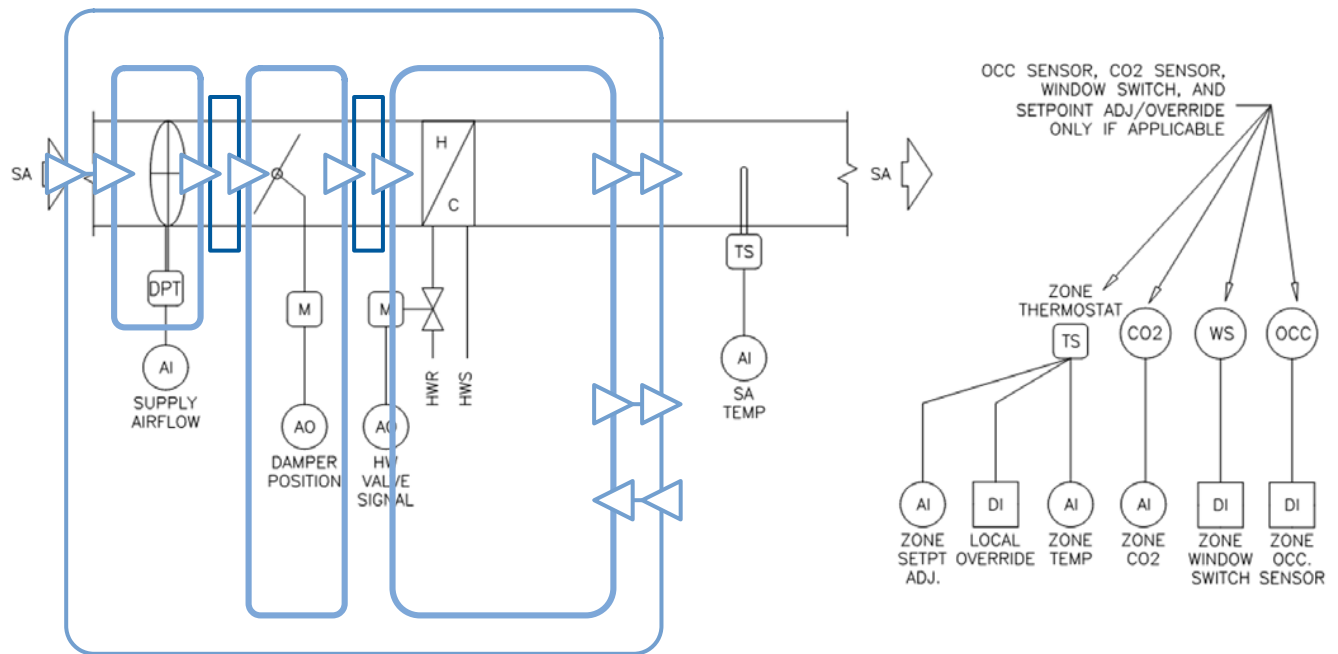

A tangible object designed to accomplish a specific task.

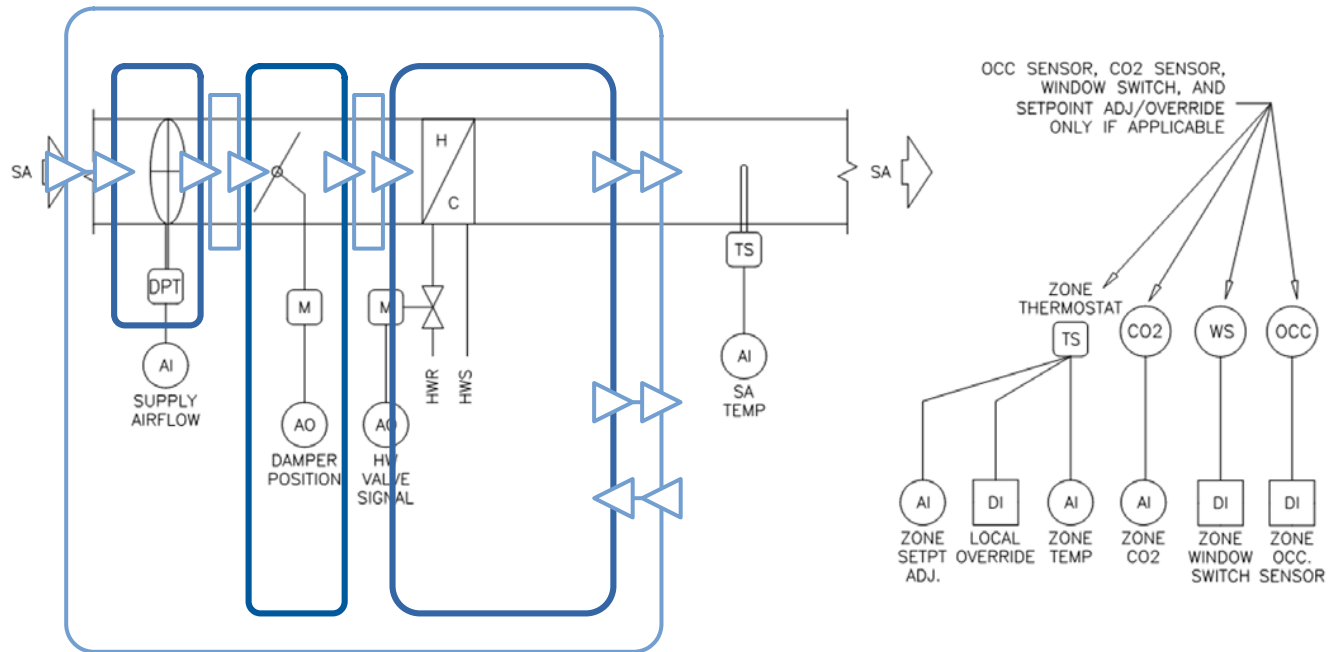

Devices also have connection points.

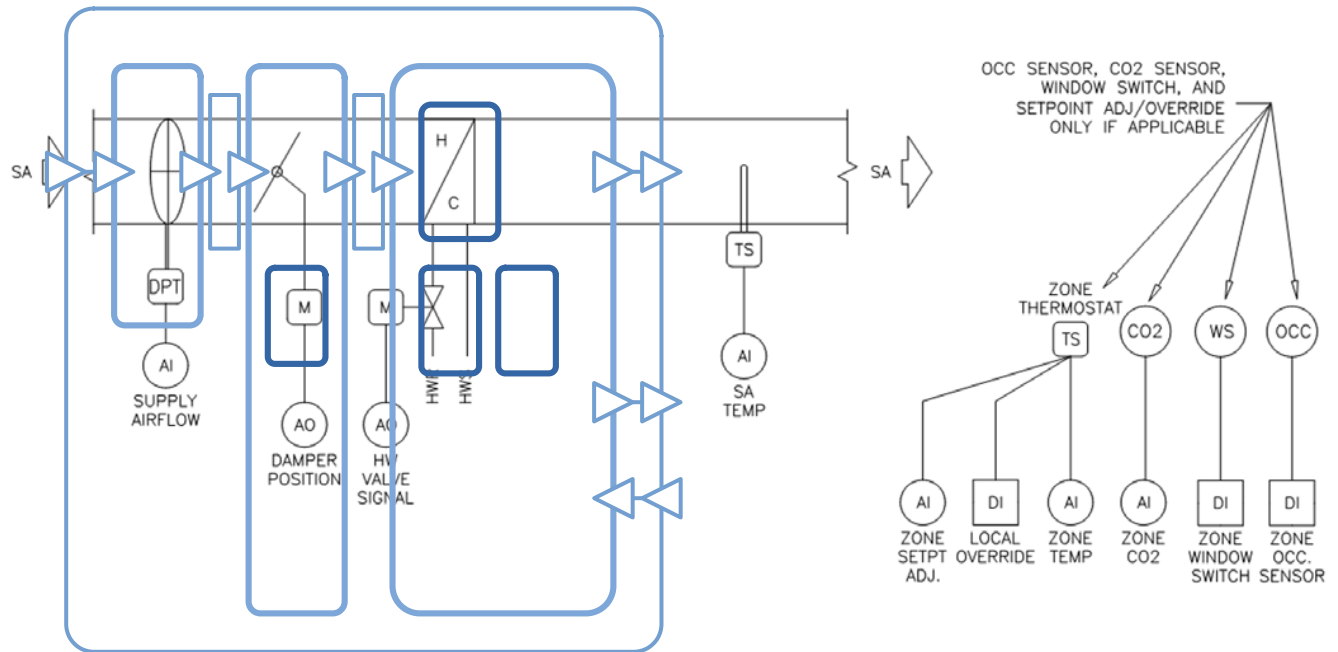

Connection objects group together inputs and outputs.

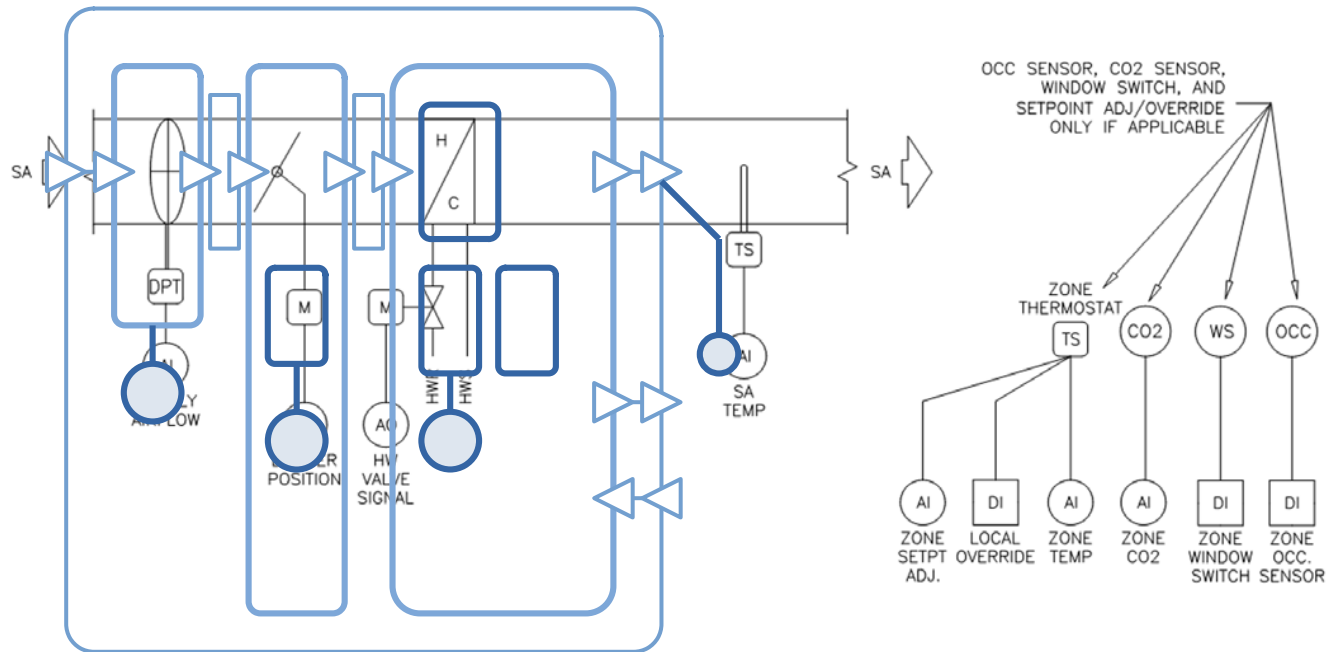

Connection objects group together inputs and outputs.

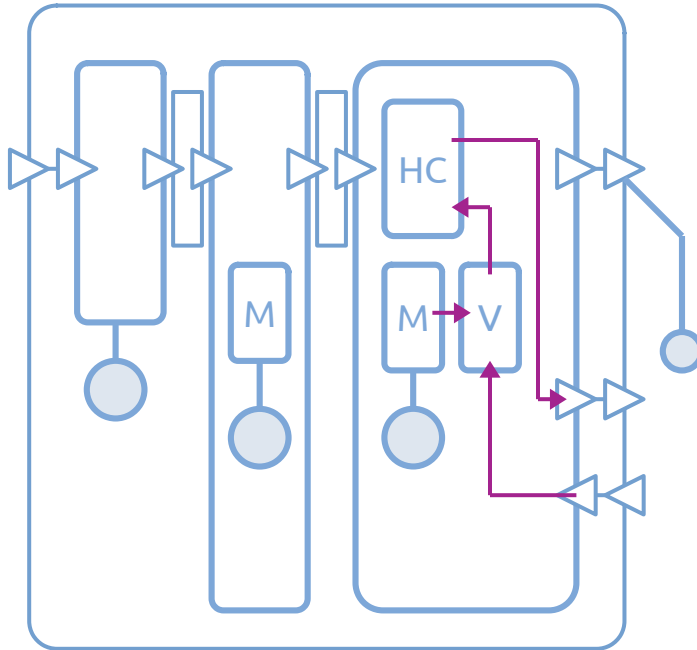

A tangible object designed to accomplish a specific task.

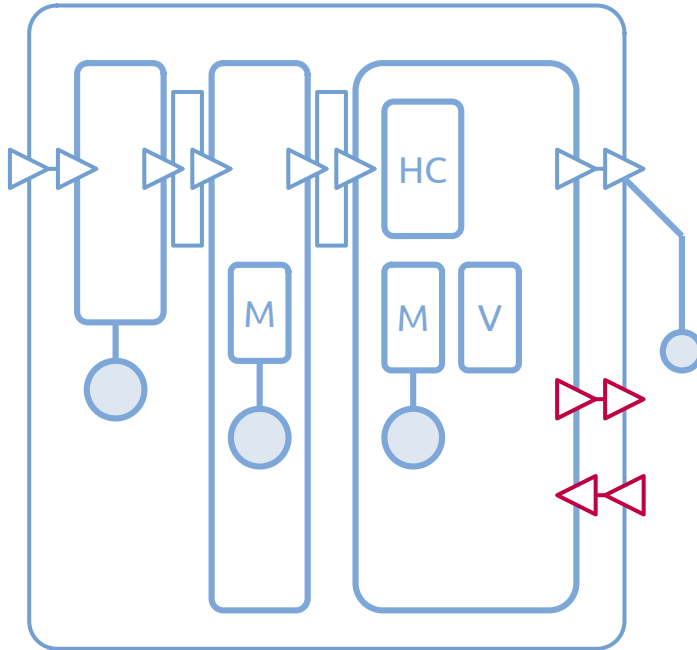

A tangible object designed to be combined with other parts to refine the composition of a Device.

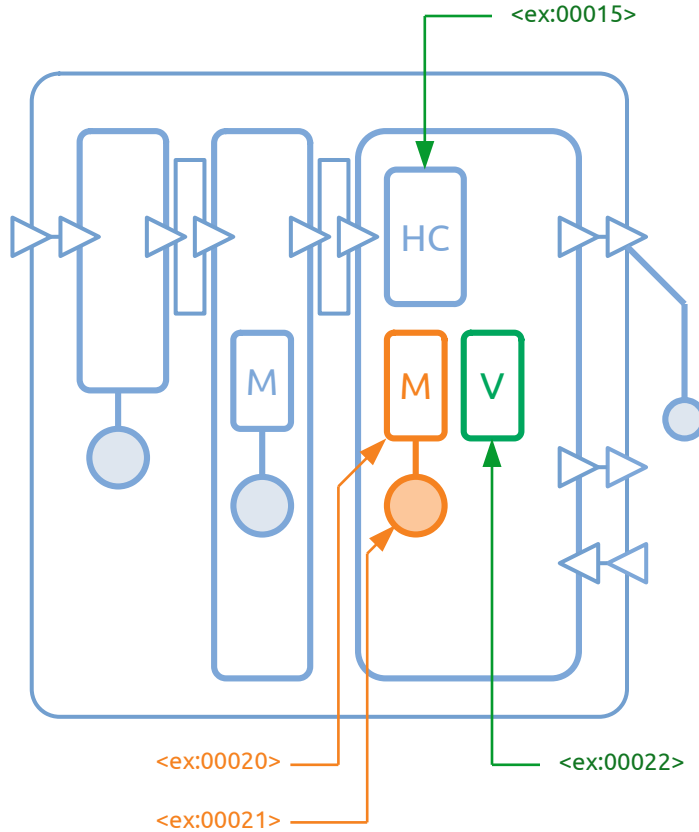

An attribute, quality, or characteristic of a feature of interest.

Interior relationships between parts in a device, such as the mechanical connection between the valve actuator and the valve, or the flow of hot water through the valve and the coil to the device connection points are not modeled.

Creating system connection points that map to internal device connection points may be necessary.
